Mt. Elgon Traditional Ecological Knowledge Center is dedicated to preserving the rich cultural heritage and natural resources of the Bamasaaba/Bagisu community in the Elgon Zone. The center's work is centered around four key task areas that aim to promote sustainable environmental management, community development, and cultural preservation.

1. Research and Documentation

One of the center's flagship research projects was a study on traditional ecological knowledge and practices among the Bamasaaba/Bagisu community in the context of environmental risk management. The study included mapping and characterization of traditionally conserved water springs and catchment areas, providing valuable insights into the community's indigenous knowledge and practices. This research aims to inform policy and practice in environmental management and conservation.

2. Advocacy and Policy Engagement

The center has worked tirelessly to engage policymakers and stakeholders in discussions on the importance of traditional ecological knowledge in conservation. Through research, documentation, and community outreach programs, the center has demonstrated the effectiveness of indigenous knowledge in managing natural resources sustainably.

Key Achievements

- Development of Policy Briefs: The center has developed policy briefs in the local language on the importance of traditional ecological knowledge in conservation, which have been presented to policymakers and stakeholders.
- **Community-Led Conservation:** The center has supported community-led conservation initiatives, empowering local communities to take ownership of their natural resources and manage them sustainably.
- **Capacity Building:** The center has provided training and capacity-building programs for community members, enabling them to effectively participate in conservation efforts and advocate for their rights.

Impact

The center's efforts have led to significant policy changes and community-led conservation initiatives. The local government has recognized the importance of traditional ecological knowledge and has incorporated it into their conservation policies. Community members are now actively involved in conservation efforts, and the region's biodiversity has benefited as a result.

3. Community Training and Sensitization

The center has launched a comprehensive community training and sensitization program aimed at educating local communities about the importance of conserving the Colobus monkey and its habitat. The program focuses on raising awareness about the threats facing the species, promoting sustainable livelihoods, and developing alternative practices that reduce the demand for Colobus monkey skins.

Key Components

- The center is working with local communities to document and promote traditional ecological knowledge related to the Colobus monkey and its habitat.
- Community Engagement: The center is engaging with local communities, cultural leaders, and traditional circumcisers to promote alternative practices and reduce the demand for Colobus monkey skins.

Impact

Mt. Elgon Traditional Ecological Knowledge Center

+256 774 930602 / +256 701 335333 Email: mtelgontek.center@gmail.com

The community training and sensitization program has shown promising results, with many community members expressing a willingness to adopt alternative practices and protect the Colobus monkey. The center's efforts have also led to increased collaboration between local communities, conservation organizations, and government agencies, ensuring a coordinated approach to conserving the species.

4. Ecosystem Restoration

The Center is working to restore degraded ecosystems in the Mt. Elgon region through a comprehensive approach that combines traditional knowledge with modern conservation practices. One of the key initiatives is the conservation of riverbanks using indigenous trees known as *Nandela*.

Mt. Elgon Traditional Ecological Knowledge Center

Ginnary Road, Nambwa Parish, Lukhonge Sub-county, Mbale District, Uganda

+256 774 930602 / +256 701 335333 Email: mtelgontek.center@gmail.com

Riverbank Conservation with *Nandela* Trees

The *Nandela* tree, (locally it means a tree with many umbilical cords or roots) native to the region, has proven to be an effective species for stabilizing riverbanks and preventing erosion. *Nandela* tree can grow both in water and on land. The center is working with local communities to plant *Nandela* trees along Manafwa riverbanks, it is estimated that one kilometers stretch of trees have been planted, which not only helps to conserve the soil but also provides habitat for various aquatic species.

Conservation of Water Springs and Catchment Areas

In addition to riverbank conservation, the center is also working to protect traditional water springs and catchment areas, Twelve water springs are so far under going conservation. There is need to conserve the over four hundred springs remaining. These areas are crucial for maintaining the region's water supply, and the center is using traditional knowledge to restore and conserve them. By doing so, the center aims to increase the production of fresh water, which will benefit local communities and support sustainable development.

Community-Led Conservation

The center's ecosystem restoration efforts are community-led, ensuring that local people are actively involved in the conservation process. This approach not only empowers communities to take ownership of their natural resources but also ensures that conservation practices are tailored to the local context.

Impact

The center's ecosystem restoration efforts have shown promising results, with improved water quality, increased biodiversity, and enhanced livelihoods for local communities. The initiative has also helped to promote sustainable land use practices, reducing the risk of landslides and erosion.
